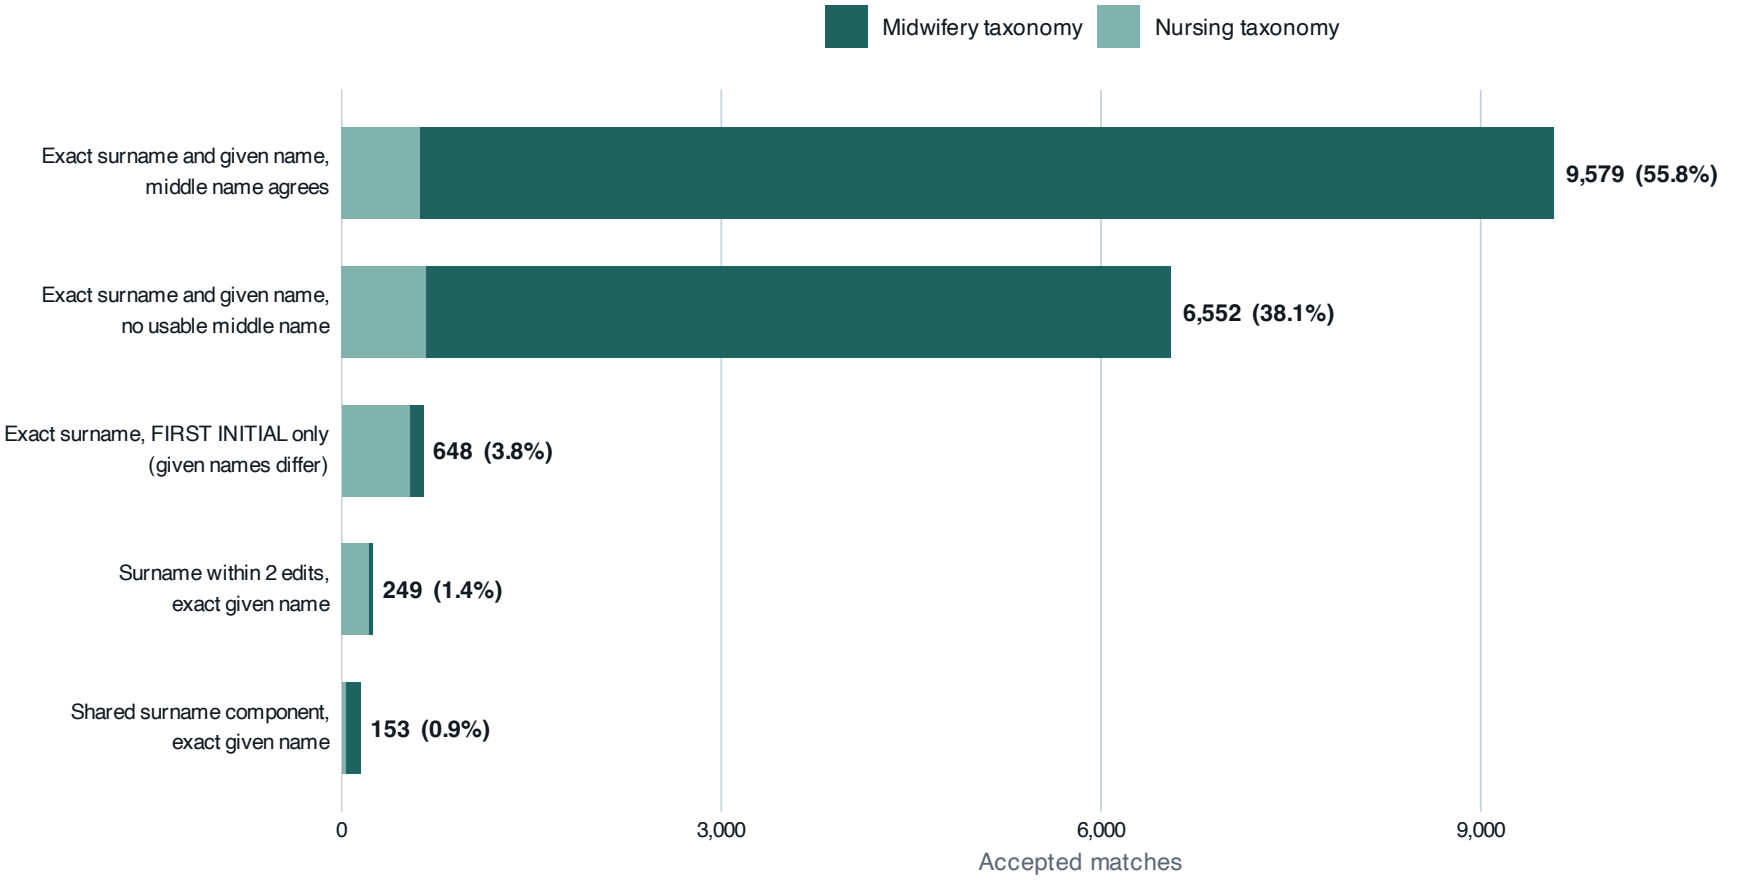
What the accepted matches actually rest on

17,181 accepted links, by the evidence class that carried each one. Classes are ordered, not scored: a record resolves only when exactly ONE candidate sits at its strongest available class.



Confidence attached to each class in the resolver: class 1 = 1.00 · class 2 = 0.90 · class 3 = 0.70 · class 4 = 0.50 · class 5 = 0.35. Class 3 is a first-initial rule, NOT a nickname dictionary – same surname, same first letter, different given name. It generates 76% of the candidate universe and the widest ties (348-way on one SMITH), so what survives ranking here is a small remainder of a large pool. A nursing-taxonomy accept at class 3 or below is two sensitivity decisions stacked. Source: artifacts/amcb_npi_linkage_FROZEN.csv
