

Metropolitan share: what the located cohort licenses about the roster

Dashed line is the share observed among the 16,636 cohort members with an assignable county.
Intervals are roster-wide and make no assumption about why geography is missing.

Discarding the 1,376 non-cohort certificants whose ZIP does resolve widens the interval without adding caution; they are 87.9% metropolitan, below the cohort rather than above it. For the roster-wide share to reach 75%, the unobserved would have to be 32.7% metropolitan – a 56.7-point departure.
